EXECUTIVE SUMMARY

More than 14,000 operations mine for coal, metal ores and non-metallic minerals in the United States, according to the Mine Safety and Health Administration. These mines provide the energy resources and raw materials that are essential to a growing economy. The ability of the U.S. economy to compete internationally and the livelihood of many American workers depend on the availability and abundance of America's valuable mined resources and their contributions to the U.S. economy. The ability of the U.S. economy to compete internationally and the livelihood of many American workers depend on the availability and abundance of America's valuable mined resources and their contributions to the U.S. economy.

National Results

U.S. mining directly and indirectly generated just over 1.9 million full-time and part-time jobs in 2012, including employees and the self-employed.

- U.S. mines accounted for more than 634,000 jobs.
- Jobs in other industries attributable to or induced by U.S. mining totaled nearly 1.27 million.

U.S. labor income associated with U.S. mining exceeded \$118 billion in 2012, which includes wages and salaries, other employee benefits and proprietors' income.

Table E-1. Economic Contribution of U.S. Mining, 2012

Item	Direct	Indirect and Induced	Total
Employment	634,600	1,268,800	1,903,440
Labor Income (billions of dollars)	\$46.2	\$71.9	\$118.2
Contribution to GDP (billions of dollars)	\$102.1	\$123.0	\$225.1
Taxes Paid (billions of dollars)	\$18.9	\$26.9	\$45.8

Source: Calculations based on IMPLAN modeling system (2012 database)

State Results

Mining contributes to economic activity in every state. The ten states with the largest contribution of mining to GDP are Wyoming (20.0%), West Virginia (17.3%), Nevada (8.7%), Montana (6.1%), Arizona (5.8%), Kentucky (4.8%), Utah (4.2%), New Mexico (3.5%), Idaho (3.2%) and Alaska (3.1%). For additional definitions of mining by sector, see Appendix B.

Total Direct, Indirect and Induced Contributions of U.S. Mining by State, 2012

State	Employment		Labor Income		Contribution to GDP		Taxes Paid (\$ Millions)	
	Number	Percent of State Total	(\$ Millions)	Percent of State Total	(\$ Millions)	Percent of State Total	State & Local	Federal
Alabama	45,840	1.8%	2,681	2.3%	4,996	2.6%	\$325	\$614
Alaska	10,970	2.3%	658	2.2%	1,727	3.1%	\$141	\$182

Contribution by Mining Segment

The direct contributions or value added by each of the three mining sectors identified in this report include the operations of the mine, support activities and transportation of output from the mine.

The coal sector of U.S. mining accounted for 708,140 jobs, \$47.1 billion in labor income and \$83.2 billion in contribution to GDP (see Table 3). Annual wages and salaries in coal mining operations (excluding support activities and transportation) averaged approximately \$80,450 in 2012.¹ Overall, the total jobs attributed to coal mining were responsible for approximately 37 percent of U.S. mining's total employment contribution, 40 percent of total labor income and 37 percent of mining's total contribution to GDP.²

The metal ore mining segment of U.S. mining accounted for 348,450 jobs, \$22.9 billion in labor compensation and \$56.3 billion of GDP. Annual wages and salaries in the metal ore mining sector averaged \$85,495. Metal ore mining accounted for 18 percent of total mining employment, 19 percent of labor income and 25 percent of mining's contribution to GDP.

The non-metallic mineral mining segment of U.S. mining accounted for 846,850 jobs, \$48.2 billion in labor compensation and \$86 billion of U.S. GDP. Annual wages and salaries in the non-metallic mining sector averaged \$55,220. Non-metallic mineral mining represented 44 percent of mining employment, 41 percent of labor income and 38 percent of its contribution to GDP.³

Table 3. Economic Contribution of U.S. Mining Operations by Segment

Sector	Coal Mining	Metal Ore Mining	Non-metallic Mineral Mining	Total
Employment				
Direct	195,490	105,260	333,890	634,640
Indirect & Induced	512,650	243,190	512,960	1,268,800
Total	708,140	348,450	846,850	1,903,440
Labor Income (\$billions)				
Direct	\$17.6	\$8.8	\$19.8	\$46.2
Indirect & Induced	\$29.5	\$14.1	\$28.4	\$71.9
Total	\$47.1	\$22.9	\$48.2	\$118.2
Contribution to GDP (\$billions)				
Direct	\$33.1	\$31.8	\$37.2	\$102.1
Indirect & Induced	\$50.0	\$24.5	\$48.5	\$123.0
Total	\$83.2	\$56.3	\$85.7	\$225.1

Tax Payments of U.S. Mining

Economic activity attributable to U.S. mining is taxed at the federal, state and local levels. These taxes take a variety of forms, including income taxes on company profits and employee wages, property taxes on equipment and structures and excise taxes on output. Table 4 provides detail on the type of taxes collected in economic activity attributable to U.S. mining.

- 1 Average wage and salary data from Bureau of Labor Statistics, Quarterly Census Employment and Wages, 2012. Labor income as presented in Table 3 results reflects total employee compensation (including benefits) and self-employment income for mining, support activities, and transportation attributable to mining output.
- 2 Data derived from IMPLAN model, which is based on data from the U.S. Bureau of Economic Analysis.
- 3 The transport of mining products, included in the figures above, represents a significant portion of these impacts. Transportation of mining output, for instance, is responsible for 240,490xxxx direct transportation jobs and also contributes to labor income and GDP. These amounts have been distributed to coal, metal ore, and non-metallic mineral mining in Table 3.

Mining activity generated \$28 billion in federal taxes and another \$18 billion in state and local taxes, for a total of \$46 billion in 2012.

Table 4. Tax Payments Attributable to U.S. Mining Economic Activity, 2012
(millions of dollars)

	Tax Category	Direct	Indirect and Induced	Total
Federal	Corporate Income Taxes	\$3,277	\$3,126	\$6,403
	Personal Taxes	\$3,243	\$5,148	\$8,392
	Indirect Business Taxes	\$700	\$1,039	\$1,739
	Social Insurance Contributions	\$4,396	\$6,885	\$11,281
	Federal Total	\$11,616	\$16,199	\$27,815
State & Local	Corporate Income Taxes	\$502	\$451	\$953
	Personal Taxes	\$1,175	\$1,876	\$3,051
	Indirect Business Taxes	\$5,514	\$8,229	\$13,743
	Social Insurance Contributions	\$82	\$129	\$211
	State & Local Total	\$7,274	\$10,684	\$17,958
Federal, State & Local Total		\$18,890	\$26,883	\$45,773

Methodology

The economic contributions of U.S. mining to the domestic economy include its direct impact plus the economic activity of other industries that supply the mining industry. To quantify these linkages, we rely on the IMPLAN model, an input-output (I-O) model based on federal government data.

- Direct contributions: effects directly attributable to mining, such as the employment and output of mining companies. These effects include the transportation of mine output from the mine to the purchaser.
- Indirect contribution: effects of upstream suppliers to mining, including contractors and other companies providing inputs to mining companies, e.g. equipment manufacturers. Indirect effects also include the activity of suppliers to these companies.
- Induced contribution: spending by mining and supplier employees. Employees throughout the supply chain receive income associated with the direct and indirect activities, a portion of which is consumed. This consumption causes additional economic activity attributable to U.S. mining.

We have made adjustments to the output of the IMPLAN model to provide a more complete and accurate description of the overall contribution of U.S. mining.

See Appendix A for a more detailed description of our methodology.

This analysis can be considered conservative in that it does not include the economic or employee benefits from coal and uranium-based generation of, or the manufacturing and other end-users of metal and non-metal minerals. According to the Edison Electric Institute, U.S. electricity generation directly employed approximately 500,000 people in 2012 and added \$363.7 billion to the U.S. economy; coal and uranium are responsible for 58.4 percent of total electricity generation. The U.S. Geological Survey estimates that mineral commodities were transformed into \$2.4 trillion worth of goods and services in 2012, an amount equal to 15 percent of the total U.S. GDP.

MINING AND THE U.S. ECONOMY BY STATE

Table 5. Mining and the U.S. Economy by State, 2012

State	Employment		Labor Income		Contribution to GDP		Taxes Paid (\$millions)

Details Regarding IMPLAN Methodology and Data

To evaluate the overall economic contribution of U.S. mining in 2012, we followed two general steps: first, derive the direct impacts of mining; and second, adjust the IMPLAN model output to capture a more complete estimate of the overall impact.

Derivation on Direct Impacts

As described in the report, the IMPLAN model produces economic multipliers to calculate the overall economic contribution of U.S. mining in terms of the direct, indirect and induced impacts. For U.S. mining, the codes in the IMPLAN model align with the NAICS codes presented in the report for the definition of the U.S. mining industry (see Appendix D).

The IMPLAN model relies on employment data from the U.S. Bureau of Economic Analysis (BEA). However, the Mine Safety and Health Administration (MSHA) also collects information on mining industry employment. We believe that the MSHA data more accurately reflect the true direct employment situation of the mining industry. We have applied IMPLAN multipliers to the MSHA data to derive indirect and induced impacts and rounded employment data to the nearest 10 employees.

The BEA classifies contractor activity closely related to mining, such as contract blasting and drilling, in the “Support Activities for Mining” sector (NAICS 213113, 213114, and 213115). These codes also include some activity completed by the mine operator on a fee or contract basis. More generalized services that could be offered to a variety of industries are classified in the industry code associated with the activity, such as Construction (NAICS 23). The IMPLAN model does not break the Support Activities for Mining sector into the coal, metal and non-metallic minerals segments. We allocated the overall activity to the sectors based on national estimates from MSHA and the direct employment of mine workers in each sector.

Data on the contribution to GDP, labor income, and taxes paid, and categorized by state are derived from the IMPLAN model multipliers applied to MSHA data.

Adjustments to IMPLAN Model

Economic multipliers are designed to measure the overall change in production that would result from a marginal increase in a particular industry. For example, an output multiplier converts a \$1 million increase in output of the mining sector into the total change in output throughout the supply chain. Because some suppliers of U.S. mining might rely on mining for inputs, a marginal change in the mining sector could lead to an additional change in mining activity attributable to the goods it provides its suppliers throughout the economy. This impact is appropriate to include when modeling a marginal change, but when evaluating the overall impact of the industry, these indirect, own-industry impacts should be excluded to prevent double-counting. Therefore, we have adjusted the IMPLAN model results to exclude any indirect or induced effects taking place in the mining industry.

I-O models capture the upstream relationships, but certain downstream impacts are not reflected in the economic multipliers. Some of these effects, such as the transportation of mine output to the purchaser, could be attributable to U.S. mining. To capture the economic activity associated with the transportation of mining output, we have relied on sector-specific transportation margins in the IMPLAN model. Based on these margins, we have estimated the direct, indirect, and induced economic activity associated with this activity at a state level.

Because IMPLAN state models capture only the indirect and induced effects within each state, the indirect and induced effects crossing state borders (“cross-state spillover effects”) are not captured by the IMPLAN state models. As such, the state-level indirect and induced impacts calculated by the IMPLAN state models must be adjusted to add up to the overall impact captured by the national model, which includes the cross-state effects. We therefore allocated the cross-state

indirect and induced employment, labor income, and contribution to GDP effects across the 50 states and the District of Columbia in proportion to each state's share of the total national employment, labor income, and contribution to GDP by industry. The state level indirect and induced effects reported throughout this study include such allocations of cross-state spillover effects.

Appendix A. NAICS Definition of U.S. Mining

Mining Division	Detail	NAICS Code	Description
Coal	Bituminous Coal and Lignite Surface Mining Bituminous Coal Underground Mining Anthracite Mining	212111 212112 212113	This segment includes establishments engaged in: (1) mining bituminous coal, anthracite, and lignite by underground mining, auger mining, strip mining, culm bank mining, and other surface mining; (2) developing coal mine sites; and (3) beneficiating (i.e., preparing) coal.
Metal Ore Mining	Iron Ore Mining Gold Ore Mining Silver Ore Mining Lead Ore and Zinc Ore Mining Copper Ore and Nickel Ore Mining Uranium-Radium-Vanadium Ore Mining All Other Metal Ore Mining	212210 212221 212222 212231 212234 212291 212299	This segment includes establishments primarily engaged in developing mine sites or mining metallic minerals, and establishments primarily engaged in ore dressing and beneficiating operations, such as crushing, grinding, washing, etc. Beneficiating may be performed at mills operated in conjunction with the mines served or at mills operated separately.
Non-metallic Mineral Mining and Quarrying	Dimension Stone Mining/Quarrying Crushed/Broken Limestone Mining/Quarrying Crushed/Broken Granite Mining/Quarrying Other Crushed, Broken Stone Mining/Quarry Construction Sand and Gravel Mining Industrial Sand Mining Kaolin and Ball Clay Mining Clay, Ceramic, Refractory Minerals Mining Potash, Soda, and Borate Mineral Mining Phosphate Rock Mining Other Chemical and Fertilizer Mineral Mining All Other Non-metallic Mineral Mining	212311 212312 212313 212319 212321 212321 212324 212325 212392 212392 212393 212399	This segment includes establishments primarily engaged in developing mine sites, or in mining or quarrying non-metallic minerals (except fuels). Also included are certain well and brine operations, and preparation plants primarily engaged in beneficiating non-metallic minerals.
Support Activities for Coal, Metal, and Non-metallic Mining	Support Activities for Coal Mining Support Activities for Metal Mining Support Activities for Non-metallic Minerals Mining	213113 213114 213115	This segment includes establishments primarily engaged in providing support activities for coal, metal, and non-metallic mining (except site preparation and related construction activities) on a contract or fee basis. Exploration for coal is included in this industry. Contract activities can be performed in-house by mining operators.

Appendix B. The IMPLAN Model

IMPLAN is a well-known modeling system developed by the Minnesota IMPLAN Group for estimating economic impacts and is similar to the Regional Input-Output Modeling System developed by the U.S. Department of Commerce. The model is primarily based on government data sources. It can address a wide range of impact topics in a given region (county, state) or the country as a whole.

IMPLAN is built around an “input-output” table that relates the purchases that each industry has made from other industries to the value of the output of each industry. To meet the demand for goods and services from an industry, purchases are made in other industries according to the patterns recorded in the input-output table. These purchases in turn spark still more purchases by the industry’s suppliers, and so on. Meanwhile, employees and business owners make personal purchases out of the additional income that is generated by this process, further increasing demand that ripples through the economy. Multipliers describe these iterations. The Type I multiplier measures the direct and indirect effects of a change in economic activity. It captures the inter-industry effects only, i.e., industries buying from local industries. The SAM (Social Accounting Matrix) multiplier captures the direct and indirect effects. In addition, it also reflects induced effects (i.e. changes in spending from households as income increases or decreases due to the changes in production).
